**DIGITAL SKILL CONNECTION**

*Business Process Modeling – Project Explanation*

***Tagline: Connecting Skills to Opportunities***

**1. Project Overview**

Digital Skill Connection is a digital services marketplace that connects customers with skilled workers across Rwanda through a website and mobile-friendly interface. It addresses unemployment, difficulty finding trusted workers, and limited access to customers by offering services such as plumbing, electrical installation, cleaning, mechanics, and tailoring. Revenue is generated through commissions on completed jobs and worker subscriptions.

**2. Project Aim**

The platform aims to create a trusted digital environment where customers can easily find skilled workers, request services, make payments, and provide feedback, while helping workers increase visibility, access customers, and earn income.

**3. Actors and Responsibilities**

**Customer:** Searches services, selects workers, submits job requests, pays, and provides ratings, reviews, or complaints.

**Skilled Worker:** Registers, submits skills for verification, accepts/rejects requests, agrees on price and schedule, and delivers services.

**Administrator:** Verifies worker profiles, investigates complaints, resolves disputes, and records resolutions.

**Platform:** Matches verified workers, forwards requests, suggests alternatives, records transactions, calculates commissions, and updates ratings.

**Payment Service:** Processes customer payments, confirms transactions, and transfers remaining amounts to workers after commission deduction.

**4. Business Process Description**

The process starts when a customer searches for a service category. The platform displays matching verified workers; the customer selects one and submits a job request. The worker accepts or rejects the request (if rejected, the platform suggests an alternative). Upon acceptance, both parties agree on price and schedule, and the worker delivers the service. The customer then pays via the payment service. On success, the platform records the transaction,

deducts its commission, and transfers the balance to the worker. Finally, the customer submits a rating and review, or files a complaint for the administrator to investigate and resolve.

**5. Data Management Activities**

Key data activities are CREATE, UPDATE, RETRIEVE and ARCHIVE. These apply to customer accounts, worker profiles, job requests, payments, transactions, ratings, and complaints.

**6. Expected Benefits**

The platform is expected to reduce unemployment, improve access to reliable service providers, promote trust between customers and workers, simplify service booking and payment, and create income-generating opportunities across Rwanda.
